You are looking for possibilities to run your business more efficiently and environmental friendly. The FIDS experts at Infologic successfully faced the challenge to reduce the energy consumption of displays considerably. Energy resources of our earth are finite.

We have to discover new means to reduce our energy consumption. We thus protect the environment so that we leave our children and grandchildren a cleaner earth.

Moreover, this environmental saving provides you with a tremendous energy cost reduction of up to **80%!**

We at Infologic developed our FIDS software in such a way that all displays over the airport are controlled individually in the most economical way. The FIDS software adjusts the backlights of the displays depending on the reproducible colors and light intensity on the display panels. Interdependency in display groups will be factored so that all displays adapt to the same intensity. Displays presenting no information can be switched off and back on when new information becomes available.

All benefits at a glance:

- Save energy consumption of displays up to 80%
- Individual control of display backlights
- Interdependent displays in display groups
- Groundbreaking new technology
